

Project:
Kinard Junior High School
Fort Collins, Colorado

Building Type: Education

To maximize student academic performance, designers integrated Solatube Daylighting Systems, into the classrooms of Kinard Junior High School.

Objective

The Solatube Daylighting Systems are supplements to the aggressive energy efficiency goals of the school and helped to reduce the amount of electric lighting needed during the normal school day.

Products Used

- 66 Solatube 21-C (21 in/530 mm Daylighting Systems) with Prismatic Diffusers
- 43 Solatube 290 DS (14 in/350 mm Daylighting Systems) with Prismatic Diffusers

Solution

Natural daylighting is a critical component of the high performance schools in Poudre School District. Kinard Junior High School is the latest example of how Solatube products can enhance classrooms, corridors and restroom areas. By using the Solatube Daylighting Systems in the upstairs corridors, they eliminated the need for electric lighting during daytime hours.

Testimonial

By incorporating Solatube Daylighting Systems on both the north- and south-facing classrooms, they allowed a balance of natural daylight from our window wall system. The combination of high performance windows and Solatube products, substantially reduces the amount of electric lighting needed during the day.

Solatube Daylighting Systems provide wonderful natural lighting in our upstairs restroom facilities, again eliminating the need for electric lights during the day.

We feel that Kinard Junior High School is an excellent example of providing students and staff with exceptional natural daylit classrooms and also reducing our energy use. By reducing our energy costs, we can put the money we save to work in the classroom where it belongs.
